Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Recombinant protein expression system for fusion protein production - useful for high quantity production of authentic recombinant proteins

Example 3; Page 133-134; 194pp; English.

Fusion

```
ö
         A novel recombinant vector has been developed which comprises a nucleotide sequence encoding a fusion protein. The fusion protein comprises three domains joined together in order, from N-terminus to C-terminus, of a first domain comprising a protein of interest, a second domain comprising a hydrophilic spacer and an affinity domain, each domain comprising amino acid residues. The present sequence represents the hinge/Fc region of human IgG1, used in example 3 of the present invention. The recombinant vector is used for the production of authentic recombinant proteins of interest. The method of the invention at use useful for the expression of fusion proteins capable of isolation by affinity chromatography in pro- or eukaryotic cells. This method allows for the efficient cleavage and generation of authentic proteins of interest that do not contain extraneous (i.e. non-naturally occurring)
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ISKAKGQPREPQVYTLPPSRDELTKNQVSLTCLVKGFYPSDIAVEWESNGQPENNYKTTP 180

                                                                       The present invention describes a fusion peptide which consists of the extracellular domain of a mammalian oxidized LDL (low density lipoprotein) receptor, fused to a partial heavy chain of a mammalian immunoglobulin containing all or part of the constant region. Oxidized LDL is a denatured form of LDL occurring in patients having rarteriosclerosis or hyperlipidaemia, and the fusion peptide can be used for the assay of oxidized LDL in biological samples from such patients, for the diagnosis of the disorders. It can also be used therapeutically for the prevention and treatment of arteriosclerosis any hyperlipidaemia. The present sequence represents the protein from the vector DNA of pcd5lnegl comprising human 1gG1 Ec region genomic DNA.

                 The gene coding for human alkaline phosphatase is fused downstream of a gene coding for either the variable and CHI regions of an antibody heavy chain or an antibody light chain. Coexpression of the H- and L-chain sequences, one of which is fused to the AP gene, results in production of AP-labelled antibodies suitable for use in immunoassays. The present sequence is from a human IgG heavy chain

The sequences given in R43685-86 represent human immunoglobulin constant regions which were used in the production of the humanised p-selectin blocking antibody, along with the heavy and light chain variable region coding sequences of the murine monoclonal antibody PB1.3, given in R43687-88. The CDRs from PB1.3 heavy and light chains were substituted for the CDRs of human heavy and light chains. The humanised variable regions were inserted into expression vectors. By coexpression of appropriate combinations of heavy and light chains, several humanised antibodies can be expressed. Coexpression of pHCMV-17478RHa-sammalci-dhfr and pHCMV-1748RLa-KR-neo gives rise to the PB1.3/Humanised version A. Coexpression of pHCMV-1747-CL-KR-neo gives rise to the PB1.3 JHumanised antibodies selectively bind epitopes on P-selectin and class and chain and class and chain and class and other pathological coditions involving P-selectin and antibodies to it, esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               179
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 ISKAKGQPREPQVYTLPPSRDELTKNQVSLTCLVKGFYPSDIAVEWESNGQPENNYKTTP 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fas ligand; Fas antagonist; apoptosis related disease; liver diseas heart failure; kidney failure; graft-versus-host disease; antibody; myocardial infarction; ischemic restenosis; endotoxic shock.
                                                                                                                                                                               It is employed in the prepn. of CD4 fusions. CD4 fusion proteins have antiviral and immunomodulatory activity and are esp. useful treating HIV infections, regardless of genetic variation within the virus. They and antibodies raised against them can also be used diagnostically for assaying adhesons and their ligands.

This represents a recombinant metFc-OB protein which consists of an Fc region of human immunoglobulin (Ig) fused to a human OB (obesity) protein. The invention provides a human OB protein suspension that contains at least 0.5 mg/ml of the human OB protein derivatised by attachment of the Fc region of an Ig to the N-terminus of OB, and has a pH 6-8. The suspensions are used to reduce weight, adiposity and blood lipid levels, to treat or prevent diabetes type II, and to increase lean mass and insulin sensitivity. They may be used in conjunction with insulin, hypoglyacemics, antihypertensives, diuretics, appetite suppressants etc. These suspensions are stable and active at physiological pH and are ready-for-use formulations that do not require freezing or freeze dryling. As they are very concentrated, only small volumes are required and they provide a sustained release effect, with increased potency and reduced frequency of injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NWYVDGVEVHNAKTKPREEOYNSTYRVVSVLTVLHODWLNGKEYKCKVSNKALPAPIEKT 12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                        This represents the antigenic peptide hFas (nd29) containing the FC region. The invention provides the use of Fas antagonist as an agent for the treatment and prevention of apoptosis-related diseases. The Fas antagonist can be a partial Fas antigen peptide containing the extracellular part of the protein, but lacking the signal sequence, an anti-Fas antibody, or an anti-Fas ligand antibody, where the antibody is preferably a humanised antibody. The Fas antagonist is used in the treatment and prevention of diseases such as myocardial infarction, heart failure, ischemic heart disease, acute kidney failure, graft-versus-host disease, ischemic restenosis of the heart, liver or kidney, and endotoxic shock, and also as an organ preservative in transplantation. The agent is of low toxicity but effectively inhibits the Fas/Fas ligand

An artificial recombinant substrate, rAGG-1 (W18574), for aggreganase comprises the CD5 signal sequence, a FLAG epitope for MI monoclonal antibody detection, the intervallobular domain of human aggrecan, and human IgG1 hinge, CH2 and CH3 regions. It is the expression product of a DNA molecule (T69892) that can be incorporated into a vector for use in rAGG-1 prodn. in host cells. rAGG-1 can be used in cell culture systems to study the activity of aggrecanase, to detect new enzymatic cleavage sites, for the affinity purification of aggrecanase, to isolate aggrecanase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encoding DNA, useful for studying aggrecanase activity e.g. by detection of cleavage products for monitoring onset or progression of osteoarthritis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a recombinant human MetFc-OB fusion protein. The invention provides Fc-OB fusion proteins whereby the Fc region of an immunoglobulin or its analogue is linked, either directly or indirectly using a linker, to the N-terminus of an OB protein or its analogue. The Fc-OB fusion proteins are claimed to demonstrate increased stability and clearance rate and decreased degradation as compared to OB protein or a fusion of Fc to the C-terminus of the OB protein. These Fc-OB fusion proteins are also claimed to be useful for treating excess associated with excess fat such as diabetes, high blood lipid level, arterial sclerosis and stroke.
                                                                                                                                Recombinant human MetFc-OB protein; chimeric; immunoglobulin; diabetes; high blood lipid level; arterial sclerosis; stroke; Fc-OB fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ISKAKGQPREPQVYTLPPSRDELTKNQVSLTCLVKGFYPSDIAVEWESNGQPENNYKTTP 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 EPKSCDKTHTCPPCPAPELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKF 60
                                                                                                                                                                                                                                                                                                                                                                An artificial recombinant substrate, rAGG-1 (W18575), for aggreganase comprises the CD5 signal sequence, a FLAG epitope for MI monoclonal antibody detection, the interglobular domain of human aggrecan, and human IgG1 hinge. CH2 and CH3 regions. It is the incorporated into a vector for use in rAGG-1 prodn. in host cells. AGG-1 can be used in cell culture systems to study the activity of aggrecanase, to detect new enzymatic cleavage sites, for the affinity purification of aggrecanase, to isolate aggrecanase cDNA by functional cloning, to screen for aggrecanase inhibitors, in methods for monitoring the onset or progression of osteoarthritis, and in diagnostic aids. Another rAGG-1 (W18574)
                                                                                                                                                                 Recombinant substrate for aggrecanase in vitro testing - and encoding DNA, useful for studying aggrecanase activity e.g. by detection of cleavage products for monitoring onset or progression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

(see also W14761) and a human 1961 heavy chain can be transiently expressed in COS cells transfected with a human KL-Ig CDNA construct (T63109) in vector CDNB, a corrected KL-Ig construct (W14765) has also been prepd. KL-Ig can also be produced as a dimer stabilised by intermolecular disulphide bonds or a peptide linker. The stabilised KL-Ig dimers have a more favorable cell prolliferation:mast cell activation ratio than native KL and can stimulate haematopoietic recovery or stem cell/progenitor cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A fusion protein (W14764) between human soluble kit ligand (KL)

                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is porcine CTLA-4-Ig construct for xenograft specific immunosuppression. In a pig-to-human transplantation, the soluble protein could comprise the extracellular domain of porcine CTLA-4 fused to a human C gamma I chain of IgG1. This construct was subcloned into the expression vector pHOOK-3TM and used to transfect DAP.3 or CHO-K1 cells. pCTLA-4-Ig preferentially binds to porcine B7 and blocks its interaction with CD28 on recipient T-cells. This is useful as a species-specific reagent to inhibit human T-cell proliferative responses to a variety of stimulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NWYVDGVEVHNAKTKPREEQYNSTYRVVSVLTVLHQDWLNGKEYKCKVSNKALPAPIEKT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (see also W14761) and a human igGl heavy chain can be transiently expressed in COS cells transfected with a human KL-1g cDNA construct (163110) in vector CDM8. KL-Ig can also be produced as dimer stabilised by internalceular disulphide bonds or a peptide linker. The stabilised KL-Ig dimers have a more favorable cell proliferation:mast cell activation ratio than native KL and can stimulate haematopoietic recovery or stem cell/progenitor cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EPKSCDKTHTCPPCPAPELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKF

SUBCELLULAR LOCATION: EXTRACELLULAR.
118SUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN LIVER, LUNG,
BRAIN, HEART, KIDNEY, STOWACH, INTESTINE, SKIN, CALVARIA AND
PLACENTA. NOT DETECTED IN SPLEEN.
DEVELOPMENTAL STAGE: IN THE EMBRYO, HIGH LEVELS ARE DETECTED AT
DAY 7. AT DAY 11, EXPRESSION DECREASES AND THEN INCREASES FROM DAY
15 TO DAY 17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HRSCPPGSGVVQAGTPERNTVCKKCPDGFFSGETSSKAPCIKHTNCSTFGLLLIQKGNAT 180

OF OSTEOCLAST DIFFERENTIATION AND ALLOWING ACCUMULATION OF NEWLY SYNTHESIZED BONE AND CARTILAGE. MAY INHIBIT IN VITRO OSTEOCLASTOGENESIS BY INTERUPTING CELL-TO-CELL SIGNALING BETWEEN
                                                                                                                                                                                                                                                                                                                                     FISSUE SPECIFICITY: EXPRESSED AT HIGHEST LEVELS IN LUNG, HEART, KIDNEY, PLACENTA, THYROID, SPINAL CORD AND LIVER. ALSO DETECTED AN UNBER OF OTHER HEMAPOPOIETIC AND IMMUNE ORGANS. NOT DETECTED THE PANCREAS OR PERIPHERAL BLOOD LYMPHOCYTES.

-! SIMILARITY: CONTAINS A LA-NGFR/THER-TYPE CYSTEINE-RICH REGION.

```
The present sequence is rat osteoprotegerin (OPG). Anti-OPG antibodies can be used in OPG diagnostic assays, and as affinity purification materials. The OPG cDNA can be used to express recombinant OPG and to generate transgenic animals. It can also be used to regulate the level of OPG in mammals, specifically to increase OPG levels, however the use of antisense sequences is also contemplated. Fragments of the cDNA can be used as probes to detect OPG expressing cells and tissue, and to screen cDNA libraries for related sequences. OPG can be used to treat or operate thom diseases, specifically excessive bone loss, e.g. osteoporosis, Paget's disease, hypercalcaemia, hyperparathyroidism, rheumatoid arthritis, osteomyelitis, ;, osteopytic metastases, periodontal bone loss, bone necrosis and
 prevention;

                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                       The present sequence is mouse osteoprotegerin (OPG). Anti-OPG antibodies can be used in OPG diagnostic assays, and as affinity purification materials. The OPG cDNA can be used to express recombinant OPG and to generate transgenic animals. It can also be used to regulate the level of OPG in mammals, specifically to increase OPG levels, however the use of antisense sequences is also contemplated. Fragments of the cDNA can be used as probes to detect OPG expressing cells and tissue, and to screen cDNA libraries for related sequences. OPG can be used to treat or osteoporosis, Paget's disease, hypercaleania, osteomyelitis, osteoporosis, Paget's disease, hypercaleania, osteomyelitis, osteopytic metastases, periodontal bone loss, bone necrosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents tumour necrosis factor receptor (TMFR) TRI, also known as osteoprotegerin. The invention relates to TMFR related polypeptides TRI, TR3 and TR5 (see VO5742-44) and their ligand TL3 (see VO5742-44) and chaimed methods of identifying agonists and antagonists, i.e. (agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or TL3. A screening kit for identifying agonists, antagonists, ligands, receptors, substrates, enzymes etc. for TR1, TR3, TR5 or TL3. A screening kit for identifying agonists and antagonists are useful for treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune disease e.g. inflammatory bowel disease, infortion, crassplant rejection, graft versus host disease,
Identifying agonists and antagonists of tumor necrosis factor related receptors TR1, TR3 and TR5, and of ligand TL3, useful for treatment of cancer, AIDS, Alzheimer's disease, bone disease etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            infection, stroke, ischaemia, acute respiratory disease syndrome,

The method comprises: (a) (i) contacting TR1 or TR2 with a candidate compound in the presence of TL2 or TL4; or (ii) contacting TL5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  having homology to tumour necrosis factor receptor. The sequence was deduced from that of a cDNA clone (see V69277) isolated from a cardiac coronary artery smooth muscle cell library. FTHMA-070 nucleic acids and polypeptides of the invention are useful as modulating agents in regulating a variety of cellular processes. They can be used for identifying compounds which bind to or modulate the activity of the polypeptides (claimed). They can also be used in screening assays, detection assays (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials, and pharmacogenomics), and methods of treatment (e.g. therapeutic and prophylactic) e.g. for neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        factor (OCIF) of the invention. The OCIF has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C. and is lost after 10 mins at 90 deg.C. outseful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding osteoclastogenesis inhibitory factor protein - useful bone resorption control, esp. treatment of osteoporosis

The present sequence represents human OCIF genome DNA protein which is specifically claimed in the present invention. The present invention describes: (1) a method of inhibiting the formation of osteoclasts and/or antipyretic proteins, which have the following characteristics: (1) MW determined by SDS-PAGE of approximately 60 kDa under reducing conditions, and 60 kDa and 120 kDa under non-reducing conditions; (11) (see W5229); (11) affinity to cation exchangers and heparin; (1v) its osteoclast formation inhibiting activity reduced by heating at 70 degrees Celsius for 10 minutes or 56 degrees Celsius for 10 minutes or 56 degrees Celsius (20 30 minutes, and (2) a method for preparing the sologous proteins. The proteins are useful for, e.g. treatment and prevention of osteoporosis, rheumatism or multiple sclerosis, and also as antigens for immunological diagnosis of these diseases and disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

recombinant OPG and to generate transgenic animals. It can also be used to regulate the level of OPG in mammals, specifically to increase OPG levels, however the use of antisense sequences is also contemplated. Fragments of the CDNA can be used as probes tdetect OPG expressing cells and tissue, and to screen cDNA libraries for related sequences. OPG can be used to treat or prevent bone diseases, specifically excessive bone loss, e.g. osteoporosis, Paget's disease, hypercalcaemia, hyperparathyroidism, rheumatoid arthritis, osteomyelitis, osteolytic metastases, periodontal bone loss, bone necrosis and

                                                                                                                                                             This sequence represents the human osteoprotegrin (OPG). The invention relates to a method of treating or preventing cardiovascular disease by administering OPG. The method can be used to treat and prevent cardiovascular diseases associated with occlusion and calcification of blood vessels, especially atherosclerosis or Monckeberg's arteriosclerosis, i.e. medial calcific sclerosis. Using OPG to treat or prevent cardiovascular diseases provides an alternative to invasive treatments. OPG can be used as a single therapeutic for prevention and treatment of both osteoporosis and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                239

the Internation in the line a vector, which is then used to transfect the host cell. The TRI receptor can bind both TNF-alpha and TNF-beta. TRI receptor and bind both TNF-alpha and TNF-beta. TRI receptor agonists can be used for inhibition of tumour growth and necrosis of tumours. They can also be used to stimulate cellular differentiation, e.g. T cell, fibroblasts or haematopoietic cell differentiation, may be used to augment TRI's role in the host's defence against microorganisms and prevent related disease. The agonists may also be used to protect against the deleterious effects of ionising radiation produced during a course of radiotherapy, e.g. denaturation of enzymes, lipid peroxidation or DNM damage. The agonists may further be used to mediate an anti-viral response, to regulate growth, to mediate the immune response and to treat immunodeficiencies related to diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                such as HIV. Antagonists to the TRI receptor may be used to treat autoimmune diseases, e.g. graft versus host rejection and allograft rejection, and T cell mediated autoimmune diseases. They may also be used to prevent apoptosis. They may also be used to prevent apoptosis. They may also be used to treat septic shock, meningococcemia, inflammation, bacterial infections, cachexia, cerebral malaria or AIDS. The products can also be used for diagnosing the above diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               60 TLCVPCPDHSYTDSWHTSDECVYCSPVCKELQSVKQECNRTHNRVCECEEGRYLEIEFCL 119
                                                                                                                                                                                                                                                                                                                     New isolated tumour necrosis factor receptor - useful for developing products for treating, e.g. tumours, auto-immune disease(s), graft rejection, apoptosis or inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       59
                                                                                                                                                                                                                                                                                                                                                                                                                                                the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20S in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore

                                                                                                                                                                               5
              osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C195 in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. Co 30 mins at 56 deg. C, and is lost after 10 mins at 70 deg. Co CIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto action-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    deg.C. OCIF is useful in the control of bone resorption and uncreasing the treatment and prevention of disorders of bone resorption, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C225 in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C ocities useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120 KHRSCPPGSGVVQAGTPERNTVCKKCPDGFFSGETSSKAPCIKHTNCSTFGLLLIQKGNA 179

```
This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C21S in which the 21st Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto action-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                 359
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;

1-1-FUNCTION: BINDS TO THE SH2 DOMAINS OF PROTEIN-TYROSINE PHOSPHATASE
2C (SHP-2) AFTER TYROSINE PHOSPHORYLATION INDUCED BY VARIOUS
MITOGRNS AND CELL ADHESION. PROTEIN SUPPORTS ADHESION OF
CEREBELLAR NEURONS, NEURITE OUTGROWTH AND GLIAL CELL ATTACHMENT.
MAY PLAY A KEY ROLE IN INTRACELLULAR SIGNALING DURING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PRIMARILY ASSOCIATES WITH SHP-1.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE ROCDUCTS: THREE FORMS; ISOFORMS I (SHOWN HERE), 2 AND ALTERNATIVE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: EXPRESSED IN THE CEREBRAL CORTEX, CEREBELLUM, SPINAL CORD, SPLEEN AND MACROPHAGES AND AT WICH LOWER LEVEL IN THE KIDNEY, HEART, LIVER AND THYMUS. WITHIN THE CEREBELLUM, EXPRESSION IS DETECTED IN THE SYNAPTIC GLOMERUIL, GRANULE CELL BODIES, GOLGI EPITHELIAL CELLS, OLFACTORY BULB, NOUFONS IN THE HPOCAMPUS AND THE DENTATE GYRUS. IN THE EXE, EXPRESSION IS FIRST SEEN IN THE INNER PLEXIFORM AND OPTIC FIBER LAYERS. LATER IN DEVELOPMENT

EXPRESION IS ALSO SEEN IN THE OUTER PLEXIFORM, RETINA AND OUTER SEGMENTS OF THE PHOTORECEPTOR LAYER.

DEVELOPMENTAL STAGE: EXPRESSED IN THE EMBRYO FROM DAY 7, WHEN EXPRESSION IS RESTRICTED TO THE FLOOR PLATE REGION OF THE VENTRAL NEURAXIS. WIDESPREAD TO THE FLOOR PLATE REGION OF THE VENTRAL STARRALS. WIDESPREAD EXPRESSION IN A VARIETY OF CNS REGIONS BEGINS SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. CONTAINS TWO C1-LIKE AND ONE V-LIKE DOMAINS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
